SONY

ICX205AL

### 1/2-inch Progressive Scan CCD Image Sensor with Square Pixel for B/W Cameras

Description

The ICX205AL is a 1/2-inch optical interline CCD solid-state image sensor with a square pixel array and 1.45M effective pixels. Progressive scan allows all pixels' signals to be output independently within approximately 1/7.5 second. Also, the adoption of high frame rate readout mode supports 30 frames per second. This chip features an electronic shutter with variable charge-storage time which makes it possible to realize full-frame still image without a mechanical shutter. High sensitivity and low dark current are achieved through the adoption of HAD (Hole-Accumulation Diode) sensors.

This chip is suitable for applications such as electronic still cameras, PC input cameras, etc.
Features

- Progressive scan allows individual readout of the image signals from all pixels.
- High horizontal and vertical resolution (both approx. 1024TV-lines) still image without a mechanical shutter.
- Supports high frame rate readout mode (effective 256 lines output, 30 frame/s)
- Square pixel
- Horizontal drive frequency: 14.318MHz
- No voltage adjustments (reset gate and substrate bias are not adjusted.)
- High resolution, high sensitivity, low dark current
- Low smear, excellent antiblooming characteristics
- Continuous variable-speed shutter

Device Structure

- Interline CCD image sensor
- Optical size: 1/2-inch format
- Total number of pixels: 1434 (H) × 1050 (V) approx. 1.50M pixels
- Number of effective pixels: 1392 (H) × 1040 (V) approx. 1.45M pixels
- Number of active pixels: 1360 (H) × 1024 (V) approx. 1.40M pixels (7.959mm diagonal)
- Chip size: 7.60mm (H) × 6.20mm (V)
- Unit cell size: 4.65μm (H) × 4.65μm (V)
- Optical black: Horizontal (H) direction: Front 2 pixels, rear 40 pixels
                                   Vertical (V) direction: Front 8 pixels, rear 2 pixels
- Number of dummy bits: Horizontal 20
                                   Vertical 3
- Substrate material: Silicon

Pin Description

Pin No.	Symbol	Description	Pin No.	Symbol	Description
1	$V\phi1$	Vertical register transfer clock	11	V_{DD}	Supply voltage
2	$V\phi2A$	Vertical register transfer clock	12	GND	GND
3	$V\phi2B$	Vertical register transfer clock	13	ϕSUB	Substrate clock
4	$V\phi3$	Vertical register transfer clock	14	NC	
5	NC		15	C_{SUB}	Substrate bias[*1]
6	NC		16	NC	
7	GND	GND	17	V_L	Protective transistor bias
8	NC		18	ϕRG	Reset gate clock
9	GND	GND	19	$H\phi1$	Horizontal register transfer clock
10	V_{OUT}	Signal output	20	$H\phi2$	Horizontal register transfer clock

[*1] DC bias is generated within the CCD, so that this pin should be grounded externally through a capacitance of 0.1μF.

Absolute Maximum Ratings

Item		Ratings	Unit	Remarks
Against ϕSUB	V_{DD}, V_{OUT}, ϕRG – ϕSUB	–40 to +10	V	
	$V\phi_{2A}$, $V\phi_{2B}$ – ϕSUB	–50 to +15	V	
	$V\phi_1$, $V\phi_3$, V_L – ϕSUB	–50 to +0.3	V	
	$H\phi_1$, $H\phi_2$, GND – ϕSUB	–40 to +0.3	V	
	C_{SUB} – ϕSUB	–25 to	V	
Against GND	V_{DD}, V_{OUT}, ϕRG, C_{SUB} – GND	–0.3 to +18	V	
	$V\phi_1$, $V\phi_{2A}$, $V\phi_{2B}$, $V\phi_3$ – GND	–10 to +18	V	
	$H\phi_1$, $H\phi_2$ – GND	–10 to +15	V	
Against V_L	$V\phi_{2A}$, $V\phi_{2B}$ – V_L	–0.3 to +28	V	
	$V\phi_1$, $V\phi_3$, $H\phi_1$, $H\phi_2$, GND – V_L	–0.3 to +15	V	
Between input clock pins	Voltage difference between vertical clock input pins	to +15	V	*1
	$H\phi_1$ – $H\phi_2$	–16 to +16	V	
	$H\phi_1$, $H\phi_2$ – $V\phi_3$	–16 to +16	V	
Storage temperature		–30 to +80	°C	
Operating temperature		–10 to +60	°C	

*1 +24V (Max.) when clock width < 10μs, clock duty factor < 0.1%.

+16V (Max.) is guaranteed for turning on or off power supply.

Bias Conditions

Item	Symbol	Min.	Typ.	Max.	Unit	Remarks
Supply voltage	V_{DD}	14.55	15.0	15.45	V	
Protective transistor bias	V_L		*1			
Substrate clock	ϕSUB		*2			
Reset gate clock	ϕRG		*2			

*1 V_L setting is the V_{VL} voltage of the vertical transfer clock waveform, or the same power supply as the V_L power supply for the V driver should be used.

*2 Do not apply a DC bias to the substrate clock and reset gate clock pins, because a DC bias is generated within the CCD.

Drive Clock Waveform Conditions

(1) Readout clock waveform

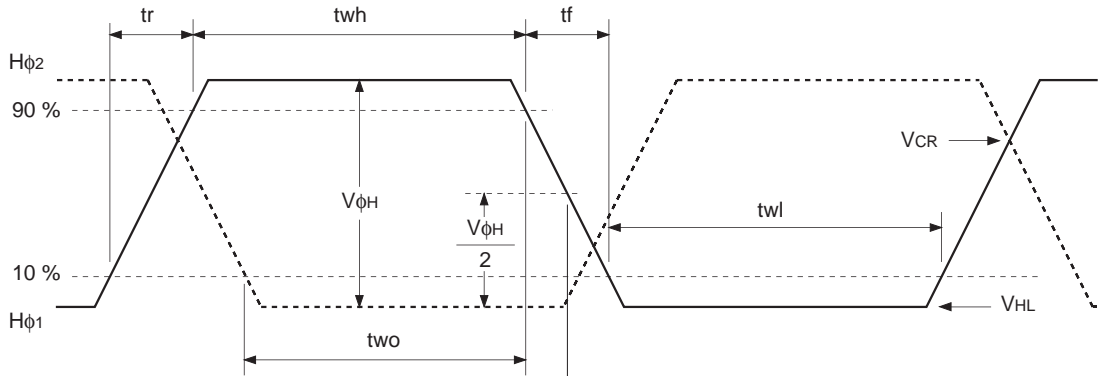

Note) Readout clock is used by composing vertical transfer clocks $V\phi_{2A}$ and $V\phi_{2B}$.

**(2) Vertical transfer clock waveform**

$V_{VH} = V_{VH02A}$
$V_{VL} = (V_{VL01} + V_{VL03})/2$
$V_{VL3} = V_{VL03}$

$V\phi_{V1} = V_{VH1} - V_{VL01}$
$V\phi_{V2A} = V_{VH02A} - V_{VL2A}$
$V\phi_{V2B} = V_{VH02B} - V_{VL2B}$
$V\phi_{V3} = V_{VH3} - V_{VL03}$

(3) Horizontal transfer clock waveform

Cross-point voltage for the Hϕ1 rising side of the horizontal transfer clocks Hϕ1 and Hϕ2 waveforms is V$_{CR}$.

The overlap period for twh and twl of horizontal transfer clocks Hϕ1 and Hϕ2 is two.

(4) Reset gate clock waveform
V$_{RGLH}$ is the maximum value and V$_{RGLL}$ is the minimum value of the coupling waveform during the period from Point A in the above diagram until the rising edge of RG.

In addition, V$_{RGL}$ is the average value of V$_{RGLH}$ and V$_{RGLL}$.

$$V_{RGL} = (V_{RGLH} + V_{RGLL})/2$$

Assuming V$_{RGH}$ is the minimum value during the interval twh, then:

$$V\phi_{RG} = V_{RGH} - V_{RGL}.$$

Negative overshoot level during the falling edge of RG is V$_{RGLm}$.

(5) Substrate clock waveform

(A bias generated within the CCD)

Clock Switching Characteristics

Item		Symbol	twh			twl			tr			tf			Unit	Remarks
			Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.		
Readout clock		VT	2.3	2.5						0.5			0.5		μs	During readout
Vertical transfer clock		Vφ1, Vφ2A, Vφ2B, Vφ3										15		450	ns	*1
Horizontal transfer clock	During imaging	Hφ1	20	25		20	25		10	15		10	15		ns	*2
		Hφ2	20	25		20	25		10	15		10	15			
	During parallel-serial conversion	Hφ1								0.01			0.01		μs	
		Hφ2								0.01			0.01

Note) Adjust the amplifier gain so that the gain between [*A] and [*B] equals 1.

Image Sensor Characteristics Measurement Method

◎ **Readout modes**

The diagram below shows the output methods for the following two readout modes.

| Progressive scan mode	High frame rate readout mode

Note) Blacked out portions in the diagram indicate pixels which are not read out.
Output starts from the line 1 in high frame rate readout mode.

1. Progressive scan mode

   In this mode, all pixel signals are output in non-interlace format in 1/7.5s.

   The vertical resolution is approximately 1024TV-lines and all pixel signals within the same exposure period are read out simultaneously, making this mode suitable for high resolution image capturing.

2. High frame rate readout mode

   All effective areas are scanned in approximately 1/30s by reading out two out of eight lines (1st and 4th lines, 9th and 12th lines). The vertical resolution is approximately 256TV-lines.

   This readout mode emphasizes processing speed over vertical resolution.

◎ **Measurement conditions**

1) In the following measurements, the device drive conditions are at the typical values of the progressive scan mode, bias and clock voltage conditions.

2) In the following measurements, spot blemishes are excluded and, unless otherwise specified, the optical black level (OB) is used as the reference for the signal output, which is taken as the value measured at point [*B] of the measurement system.

◎ **Definition of standard imaging conditions**

1) Standard imaging condition I:
   Use a pattern box (luminance : 706cd/m^2, color temperature of 3200K halogen source) as a subject. (pattern for evaluation is not applicable.) Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter and image at F8. The luminous intensity to the sensor receiving surface at this point is defined as the standard sensitivity testing luminous intensity.

2) Standard imaging condition II:
   Image a light source (color temperature of 3200K) with a uniformity of brightness within 2% at all angles. Use a testing standard lens with CM500S (t = 1.0mm) as an IR cut filter. The luminous intensity is adjusted to the value indicated in each testing item by the lens diaphragm.

1. Sensitivity
   Set to standard imaging condition I. After selecting the electronic shutter mode with a shutter speed of 1/250s, measure the signal output (Vs) at the center of the screen, and substitute the value into the following formula.

   $$S = Vs \times \frac{250}{30} \text{ [mV]}$$

2. Saturation signal
   Set to standard imaging condition II. After adjusting the luminous intensity to 10 times the intensity with the average value of the signal output, 150mV, measure the minimum value of the signal output.

3. Smear
   Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, first adjust the luminous intensity to 500 times the intensity with the average value of the signal output, 150mV. Then after the readout clock is stopped and the charge drain is executed by the electronic shutter at the respective H blankings, measure the maximum value (Vsm [mV]) of the signal output and substitute the value into the following formula.

   $$Sm = \frac{Vsm}{150} \times \frac{1}{500} \times \frac{1}{10} \times 100 \text{ [%] (1/10V method conversion value)}$$

4. Video signal shading
   Set to standard imaging condition II. With the lens diaphragm at F5.6 to F8, adjust the luminous intensity so that the average value of the signal output is 150mV. Then measure the maximum (Vmax [mV]) and minimum (Vmin [mV]) values of the signal output and substitute the values into the following formula.

   $$SH = (Vmax - Vmin)/150 \times 100 \text{ [%]}$$

5. Dark signal
   Measure the average value of the signal output (Vdt [mV]) with the device ambient temperature 60°C and the device in the light-obstructed state, using the horizontal idle transfer level as a reference.

6. Dark signal shading

 After measuring 5, measure the maximum (Vdmax [mV]) and minimum (Vdmin [mV]) values of the dark signal output and substitute the values into the following formula.

 ΔVdt = Vdmax – Vdmin [mV]

7. Lag

 Adjust the signal output value generated by strobe light to 150mV. After setting the strobe light so that it strobes with the following timing, measure the residual signal (Vlag). Substitute the value into the following formula.

 Lag = (Vlag/150) $\times$ 100 [%]

Notes on Handling

1) Static charge prevention

CCD image sensors are easily damaged by static discharge. Before handling be sure to take the following protective measures.

a) Either handle bare handed or use non-chargeable gloves, clothes or material.
   Also use conductive shoes.

b) When handling directly use an earth band.

c) Install a conductive mat on the floor or working table to prevent the generation of static electricity.

d) Ionized air is recommended for discharge when handling CCD image sensor.

e) For the shipment of mounted substrates, use boxes treated for the prevention of static charges.

2) Soldering

a) Make sure the package temperature does not exceed 80°C.

b) Solder dipping in a mounting furnace causes damage to the glass and other defects. Use a ground 30W soldering iron and solder each pin in less than 2 seconds. For repairs and remount, cool sufficiently.

c) To dismount an image sensor, do not use a solder suction equipment. When using an electric desoldering tool, use a thermal controller of the zero cross On/Off type and connect it to ground.

3) Dust and dirt protection

Image sensors are packed and delivered by taking care of protecting its glass plates from harmful dust and dirt. Clean glass plates with the following operation as required, and use them.

a) Perform all assembly operations in a clean room (class 1000 or less).

b) Do not either touch glass plates by hand or have any object come in contact with glass surfaces. Should dirt stick to a glass surface, blow it off with an air blower. (For dirt stuck through static electricity ionized air is recommended.)

c) Clean with a cotton bud and ethyl alcohol if the grease stained. Be careful not to scratch the glass.

d) Keep in a case to protect from dust and dirt. To prevent dew condensation, preheat or precool when moving to a room with great temperature differences.

e) When a protective tape is applied before shipping, just before use remove the tape applied for electrostatic protection. Do not reuse the tape.

4) Installing (attaching)

a) Remain within the following limits when applying a static load to the package. Do not apply any load more than 0.7mm inside the outer perimeter of the glass portion, and do not apply any load or impact to limited portions. (This may cause cracks in the package.)

39N	29N	29N	0.9Nm

Upper ceramic
Lower ceramic
Low melting point glass

Compressive strength   **Shearing strength**   **Tensile strength**   **Torsional strength**
b) If a load is applied to the entire surface by a hard component, bending stress may be generated and the package may fracture, etc., depending on the flatness of the ceramic portions. Therefore, for installation, use either an elastic load, such as a spring plate, or an adhesive.

c) The adhesive may cause the marking on the rear surface to disappear, especially in case the regulated voltage value is indicated on the rear surface. Therefore, the adhesive should not be applied to this area, and indicated values should be transferred to other locations as a precaution.

d) The upper and lower ceramic are joined by low melting point glass. Therefore, care should be taken not to perform the following actions as this may cause cracks.
• Applying repeated bending stress to the outer leads.
• Heating the outer leads for an extended period with a soldering iron.
• Rapidly cooling or heating the package.
• Applying any load or impact to a limited portion of the low melting point glass using tweezers or other sharp tools.
• Prying at the upper or lower ceramic using the low melting point glass as a fulcrum.
Note that the same cautions also apply when removing soldered products from boards.

e) Acrylate anaerobic adhesives are generally used to attach CCD image sensors. In addition, cyano-acrylate instantaneous adhesives are sometimes used jointly with acrylate anaerobic adhesives. (reference)

5) Others
a) Do not expose to strong light (sun rays) for long periods. For continuous using under cruel condition exceeding the normal using condition, consult our company.
b) Exposure to high temperature or humidity will affect the characteristics. Accordingly avoid storage or usage in such conditions.

Package Outline   Unit: mm

20pin DIP (600mil)

1. **"A"** is the center of the effective image area.

2. The two points **"B"** of the package are the horizontal reference.
   The point **"B'"** of the package is the vertical reference.

3. The bottom **"C"** of the package is the height reference.

4. The center of the effective image area, relative to **"B"** and **"B'"** is
   (H, V) = (9.0, 7.55) ± 0.15mm.

5. The rotation angle of the effective image area relative to H and V is ± 1°.

6. The height from the bottom **"C"** to the effective image area is 1.41 ± 0.15mm.

7. The tilt of the effective image area relative to the bottom **"C"** is less than 60μm.

8. The thickness of the cover glass is 0.75mm, and the refractive index is 1.5.

9. The notch and the hole on the bottom must not be used for reference of fixing.
